

FEATURE DATASHEET

Lock Down IP Security with Helix IPLM Geofencing

Reduce the risk of revenue loss and bring your organization into compliance with export control laws by eliminating IP leakage.

IP leakage can cost millions of dollars due to lost revenue and market setbacks. And as your network of design teams around the world grows — due to an expanding workforce, acquisition of other companies, or consolidation into a larger enterprise — your risk of IP leakage grows.

With teams collaborating across geographies, it is essential to track which IPs are visible to which users and locations around the world. You must ensure that no sensitive IP is released across borders without a proper export license in place, or else face severe export violation fines.

Eliminate IP Leakage

Geofencing is an add-on feature available in Helix IPLM (Formerly Methodics IPLM) that allows your organization to restrict IP availability in certain geographies, regardless of a user's access permissions.

A unique capability in the IPLM space, Helix IPLM enables IP Geofencing by:

- Allowing IPs to carry include and exclude lists of geographies.
- Restricting IPs, regardless of access, based on these lists.

- Ensuring IP data cannot reside in user workspaces or caches in restricted geographies.
- Ensuring IP meta-data cannot be viewed or extracted in these geographies.

With Helix IPLM Geofencing, you can ensure your organization is in compliance with export control laws including EAR and ITAR, potentially saving you millions of dollars in fines and legal issues.

Protect your valuable IP with **Helix IPLM Geofencing**.
